Introduction to Python Programming Exercises

Ali Kashefi kashefi@stanford.edu

| the most negative consequence of its absence? You need to mention only one benefit or only one negative consequence. If you write more than one, you receive zero points. |
|---|
| Please write your answer in the following box. |
| |
| |
| |
| |

Problem A1. Does the concept of a "prototype" for functions exist in Python? Based on our class discussion, if it does, what is the primary benefit of this concept? If not, what is

Problem A2. In Python, int is an immutable type; however, we can write, for instance, x = 5, and then x += 1, as shown in the code below. It appears that we can change x, even though it is immutable. Based on our class discussion, how can this paradox be resolved?

| <pre>x = 5 x += 1 print(x)</pre> | |
|--|--|
| Please write your answer in the following box. | |

Problem A3. In the following box, write the function f(x) in Python, which takes a string of digits ranging from 0 to 9 as x. It should return True if the string is a palindrome and False otherwise. A string is a palindrome if it reads the same forwards and backward, such as 12321 or 4554. For this problem, the use of loops is NOT allowed. If any loop is used in your solution, you will receive zero points.

| <pre>def f(x):</pre> | |
|-------------------------|--|
| #complete this function | |
| | |

| Problem B1 | 3. Belo | w is a | Python | code | snippet. | First, | identify | if there | are a | ny eri | ors. |
|---------------|-----------|--------|-----------|-------|-----------|---------|------------|-----------|--------|--------|------|
| Then, provide | e a brief | explan | ation for | r why | each erre | or occu | rs. If the | ere is no | error, | write | the |
| output of the | code. | | | | | | | | | | |

| <pre>name = "abcdefgh" print(name[3:6:-1])</pre> |
|--|
| If there are errors, specify the specific line(s) of code that are causing the error(s). |
| |
| |
| |
| |
| If there are errors, briefly explain why the error(s) occur(s): |
| |
| |
| |
| |
| If there is no error in the code, write the output of the code. |
| |
| |
| |
| |
| |

| Problem B14 | . Below is a Py | thon code sn | ippet. First, | identify if there | are any errors. |
|-----------------|-------------------|---------------|---------------|--------------------|------------------|
| Then, provide a | a brief explanati | on for why ea | ch error occu | rs. If there is no | error, write the |
| output of the c | ode. | | | | |

| L = [[2,3,1],[4,5,1],7] | |
|-------------------------|--|
| L[1].sort() | |
| <pre>print(L)</pre> | |

| princ(E) |
|--|
| If there are errors, specify the specific line(s) of code that are causing the error(s). |
| |
| |
| |
| |
| If there are errors, briefly explain why the error(s) occur(s): |
| |
| |
| |
| |
| If there is no error in the code, write the output of the code. |
| |
| |
| |
| |

Problem B16. Write the output of the Python code.

```
def g(x,y):
    return x+y

for val in map(g, range(3), [-2,-1,0]):
    print(val)
```

| Your answer: |
|--------------|
| |
| |
| |
| |
| |
| |
| |
| |
| |

| Problem | C1. | Below is a I | Python o | ode sı | nippet | . First, | identify | if ther | e are a | any errors. | Then, |
|-------------|-------|--------------|----------|--------|--------|----------|----------|---------|---------|-------------|--------|
| provide a | brief | explanation | for why | each | error | occurs. | If there | is no | error, | write the | output |
| of the code | e. | | | | | | | | | | |

| g = lambda x: 1 if x == 1 else g(x-1) | |
|---------------------------------------|--|
| <pre>print(g(5))</pre> | |

Problem C2. Below is a Python code snippet. First, identify if there are any errors. Then, provide a brief explanation for why each error occurs. If there is no error, write the output of the code.

| <pre>def f(*K): sum = 0 for item in K: sum += item return sum</pre> |
|--|
| print(f(1,2,3,f(2,3),f(3))) |
| If there are errors, specify the specific line(s) of code that are causing the error(s). |
| |
| If there are errors, briefly explain why the error(s) occur(s): |
| If there is no error in the code, write the output of the code. |
| |

| Problem | C3. | Below is a | a Python | code s | nippet. | First, | identify | if there | are an | ny errors. | Then, |
|------------|-------|-------------|------------|--------|---------|---------|----------|----------|---------|------------|-------|
| provide a | brief | explanation | on for why | y each | error o | occurs. | If there | is no e | rror, w | rite the c | utput |
| of the cod | e. | | | | | | | | | | |

| L = [["e", 12, -30], ["b", 8, 5], ["c", 1, 3]] |
|--|
| B = sorted(L, key = lambda x:x[1]+x[2]) |
| print(B) |

| print(B) |
|--|
| If there are errors, specify the specific line(s) of code that are causing the error(s). |
| |
| |
| |
| If there are among briefly explain why the emen(s) equiv(s). |
| If there are errors, briefly explain why the error(s) occur(s): |
| |
| |
| |
| If there is no error in the code, write the output of the code. |
| I viiere is no error in the edge, write the datput of the edge. |
| |
| |
| |

Problem C4. Below is a Python code snippet. First, identify if there are any errors. Then, provide a brief explanation for why each error occurs. If there is no error, write the output of the code.

```
def f(x):
    x += "E"
    return

def g(x):
    x.append("E")
    return

x1 = "abcd"
    f(x1)

x2 = [x1]
    g(x2)

print(x2)
```

If there are errors, specify the specific line(s) of code that are causing the error(s).

If there are errors, briefly explain why the error(s) occur(s):

If there is no error in the code, write the output of the code.

Problem C5. Below is a Python code snippet. First, identify if there are any errors. Then, provide a brief explanation for why each error occurs. If there is no error, write the output of the code.

| <pre>def compute(x = 2, y = 6): return y - x</pre> |

| |
| |
| |
| |
| If there is no error in the code, write the output of the code. |
| |
| |
| |
| |
| |

Problem C11. Write the output of the Python code.

```
class Movie():
    location = "CA"

    def __init__(self,genre):
        self.genre = genre

def main():

    A = Movie("Fiction")
    B = Movie("Romance")

    Movie.location = "NY"
    B.location = "TX"

    print(A.location)
    print(B.location)
    print(A.__dict__)
    print(B.__dict__)

if __name__ == "__main__":
    main()
```

Your answer:

Problem D1. Below is a Python code snippet. First, identify if there are any errors. Then, provide a brief explanation for why each error occurs. If there is no error, write the output of the code.

```
def g(x,L=[]):
    L.append(x)
    return L

def f(x, L=None):
    if L is None:
        L = []
    L = g(x)
    return L

L = f(2)
L = f(3)
print(L)
```

| If there are errors, specify the specific line(s) of code that are causing the error(s) |

If there is no error in the code, write the output of the code.

Problem D4. Below is a Python code snippet. First, identify if there are any errors. Then, provide a brief explanation for why each error occurs. If there is no error, write the output of the code.

```
def g(x,L=None):
    if L is None:
        L=[]
    L.append(x)
    return L

def f(x, L=[]):
    L = g(x)
    return L

L = f(2)
    L = f(3)
    print(L)
```

Problem E1. Briefly explain the role of the pack() functions in the following Python code. For instance, what happens if we do not call E.pack()?

```
import tkinter as tk

W = tk.Tk()
W.title("Python")

L = tk.Label(W, text = "Label")
L.pack()

def f():
    D.config(text = myText.get())

myText = tk.StringVar()
E = tk.Entry(W, textvariable = myText)
E.pack()

B = tk.Button(W, text = "Action", command = f)
B.pack()

D = tk.Label(W, text = "")
D.pack()

W.mainloop()
```
